

Arbela Master Data Centralization for Dynamics AX

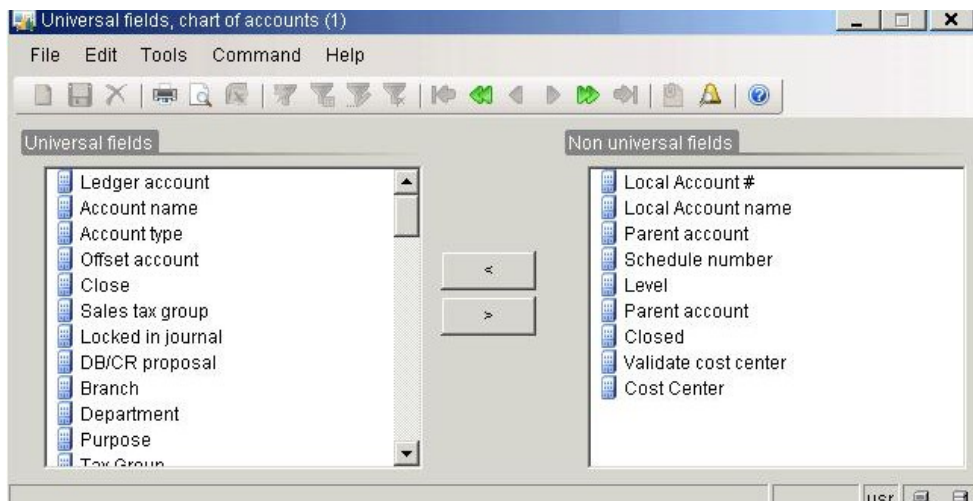

Multi-national and multi-company corporations often want or need to share Master Data between their entities. This can be necessary to ease data administration, assure consistency between entities and enhance financial system integrity across the enterprise. However, complete replication of all data may not be desirable.

Arbela Technologies' **Master Data Centralization for Dynamics AX** introduces the Universal Company, improving upon Dynamics AX's Virtual Company concept with enhancements allowing selective local subscription to Master Data records and selective local control of fields in those records. With a flexible mixture of centralized and localized processes, operating entities can be given the flexibility they need to succeed, while still providing for the structure required when diverse businesses need to be managed together.

Master Data Centralization is available for:

- **Financial Accounts** (Chart of Accounts)
- **Dimensions** with field set-ups
- **Dimension Sets** with rule hierarchies
- **Financial Statements** (including supporting tables)
- **Items** (with special treatment for Bills of Materials)
- **Customers, Vendors, and Employees**

**Consolidate with
Confidence!**

Here's how it works:

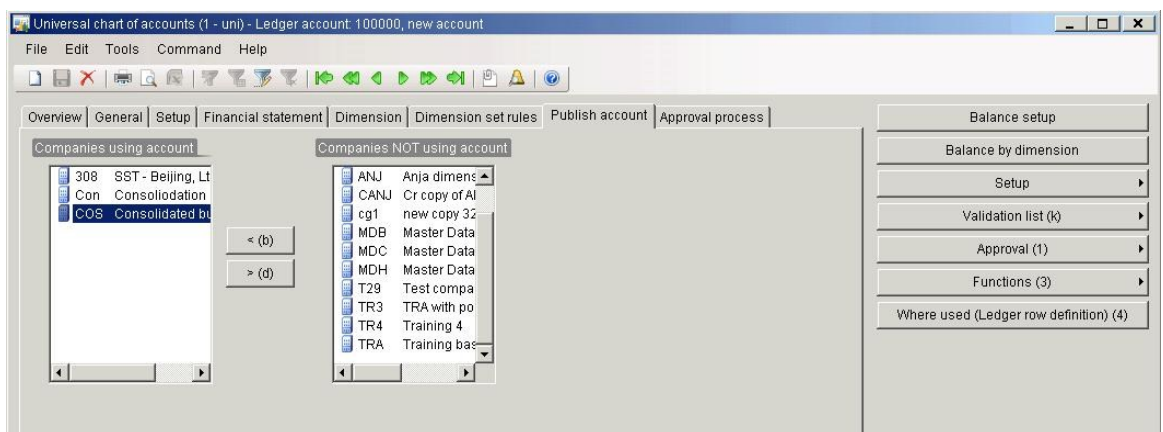

1. Master Data tables are created in the Universal Company.
2. Fields are marked as being either centrally-controlled or locally-controlled.
3. Data is published (made available) out of the Universal Company for use by all entities.
4. Local entities subscribe to the data made available, as necessary. This association can be done with either a "push" or a "pull" process.

From here, local entities can only make changes to fields marked as locally-controlled. Changes to centrally-controlled fields can only be made by an authorized user and through the Universal Company. Any change through the Universal Company will cascade down to the subscribing entities.

Changes made to locally-controlled fields will exist only for the entity making the change.

Additional features:

1. Approval process for Master Data changes—Most additions and changes to master data records can be subject to an automated approval process so that changes cannot be committed until the appropriate approval is received.
2. Where Used displays—Screens in the Universal Company indicate which entities are subscribing to the Master Data records.
