

# Argano Care Check-In App

## Check-in and communicate with others during times of crisis

The Argano Check-In App (Care App) was originally developed to help colleagues and their families in Ukraine whose lives and means of communication were shattered by the Russian invasion in March of 2022.

However, as with Argano's COVID-19 Impact Assessment Application, the ways in which the Care App could be used outside of its original impetus were immediately apparent. A mobile app that supports online, offline, and external users, the Care App provides:

- An open, fast and safe line of communication that's not dependent on an internet connection (messages can be created and stored without an internet/WiFi/cellular connection and are immediately sent once a connection becomes available)

- The ability for team members to quickly send requests for help
- The ability to easily create and delegate team member check-ins and automate contact requests
- A real-time dashboard (see Figure 1) showing team members' locations and check-in/request statuses
- Ability to upload emergency information and other data to be shared with team members through the App (like we uploaded Counseling information for a service we purchased)
- Push notifications and reminders to stay updated with the latest

**Benefits:**

- Peace of mind - Stay connected and be in touch
- 24/7 monitoring, real-time location tracking, mapping dashboard
- Deploy application and provide access within one business day

### Leveraging Azure, Power Platform, and more from the Microsoft stack

The app works on any mobile device, regardless of OS. It leverages tools from the Microsoft stack, including Power Apps, Power BI, Azure AD, and Azure Location Services.

The Argano team developed the app within a matter of days following the Russian invasion as a means of communicating with Ukrainian colleagues, and also equipping those colleagues with the means to communicate with others in their communities and country.

### Up and running within a day

The app was designed in, and for, times of crisis and uncertainty, which necessitates a rapid deployment and light footprint, and as such it can be delivered within just one day.
